

PROPOSED JORDAN LAKE RULES COMMENTS

☒ I oppose the proposed Jordan Lake Rules as currently written

My primary concerns about the Proposed Jordan Lake Rules include:

- Expensive regulations for the affected areas
- Water quality in Jordan Lake may lack signs of improvement
- Designation of entire watershed as a critical water-supply watershed will cause my water, sewer and stormwater utility fees to increase.
- Existing development requirements to increase pollution reduction measures
- Negative impacts on the regions economy due to new development regulations will place Jordan Lake watershed area at an economic disadvantage as compared to the rest of the state.

JORDAN LAKE RULES:

GET THE FACTS

• Devastating Impact on Communities

New watershed regulations proposed by the Division of Water Quality for Jordan Lake would have a devastating impact on the communities in the watershed without any clear benefit to Jordan Lake. The rules will drive up taxes, drive up the cost of housing and put unnecessary stress on local governments.

• Not Supported by Science

The rules are based on faulty science. Analysis of 10 years of data shows that only 15 months were valid and only one month suggested a problem in the Haw River arm of the watershed.

We must protect our water supplies, but the proposed Jordan Lake rules are based on faulty science, have outrageous costs and don't assure reductions in pollutant levels.

JORDAN LAKE RULES:

GET THE FACTS

• Unfunded State Mandate

Local taxpayers will bear the high cost of these rules. DENR estimates a nearly \$1 billion dollar impact for the entire watershed in the first few years, but provides no state money to implement the rules. Local water resources professionals estimate in the cost at \$2 billion to \$3 billion

• Unworkable Plan for New Development

The rules would limit density and triple storm water structures for new development. DENR's \$12 million cost estimate to new development is hugely underestimated. Private engineers put the cost at \$75 million a year or more in Greensboro and Alamance counties alone.

We must protect our water supplies, but the proposed Jordan Lake rules are based on faulty science, have outrageous costs and don't assure reductions in pollutant levels.
